Improvements

Enhancement

Restored and Enhanced Product Attributes Feature

The product attributes feature allows you to create and associate attributes to a base product and locate the product by specifying a unique combination of attributes.

The following functionality has been restored:

- The setup of attributes, base products and sub-products in Streamline™ ERP.
- In e-commerce, pricing and add-to-cart functionality are suppressed for a base product.
- A section containing attributes with drop lists (containing the attribute values) appears on the Product Details page for products identified as either base products or sub-products of a base product.
- Successfully selecting or changing attributes within that section to any combination that uniquely identifies a sub-product will automatically refresh the Product Details page with the associated sub-product.

We have added the following new functionality:

- The attributes functionality is part of Product Publishing and is now controlled in e-commerce by the integration sub-module PUB (Product Publishing).
- The Associated Products page suppresses the price on a base product.
- Additional changes were made to the Product Details of a base product:
 - Removed pricing
 - Removed Write a Review section
- All Product Details changes are also in effect when launched from Associated Products or Your Cart/Cart Review.
- Logic has been added to Quick Order and to the Add to Cart button in the Favorites Lists to ensure that a base product cannot be added to the cart.

Enhancement

Update Method used to Produce PDF Files

We have updated the way in which all forms or reports are produced as PDF documents throughout Streamline™ ERP. Instead of using SmartMail, we are switching to an internal process to initiate the printing process. The modules that have been changed with this release include:

- Accounts Payable
- Accounts Receivable
- Background Services
- EDI Framework
- Inventory
- Pricing
- PO Processing module
- Return Authorization

- Sales Analysis
- Sales Order Processing
- Service Work Order Processing
- WMS Integration

Update

Allow Customization of E-commerce Column Headings for List/Sell Price on Product Details Page

Initially the column heading for Sell Price and List Price on the page display for Products (Details View) in the E-Commerce Defaults program were hard coded to display Now and Was on the e-commerce website. We have opened up the Column Heading field on the Products (Details View) allowing you to change the label that displays on the website for these two fields. If you do not provide a column heading for either of these columns, the default of Now and Was will display on your website.

- Note: There is no upgrade script associated with this change, so sites with values in the Column Heading field for the List Price and Sell Price that were previously ignored will now display on the Product Details page in e-commerce. Sites with no values will remain unchanged.

Update

Allow Customization of E-commerce Product List/Tile Pages and Associated Products Views

Initially the content for the Product pages, both List and Tile views, and the Associated Product view were fixed in the E-Commerce Defaults program. We now allow the ability to add the available fields to the page display on the Product (List/Tile) and Associated Products pages on your website and specify the sort order of the available fields.
